Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
The present sequence encodes winter rye (Secale cereale L. cv. Mustater) CHF9 preprotein (see AMW98079). Mature CHF9 (see AAW98080) is a chitinase-like protein that has chitinase (antifugal) and antificeaze activities. CHF9 DNA (ch-9) was obtained by isolating preprotein that has chitinase (antifugal) and strong many plants grown at low temperatures in the absence of pathogens or other stresses, i.e. under conditions when only chitinases with antifreeze activity would be expressed, and then sorting the cold-induced chitinase CDNAs to determine which encoded proteins with ice-binding ability. CHF9 and CHF46 (see AAW98081-82) have been cloned and expressed in bacterial and yeast (Pichia) systems and in Arabidopsis thaliana. The chitinase-like antifreeze microorganisms exposed to increase freezing tolerance of plants and microorganisms stooped to sub-zero temperatures; to inhibit ice recrystallisation in biological materials or foods; for metroorganisms exposed to sub-zero temperature of cells, embryos, tissues etc. (particularly human platelets); and to kill tumour cells. They are also used to inhibit initiation and progression of diseases or spoilage cused by low temperature pathogens

(particularly fund) in plants, frozen foods and any cryopreserved
                                                                                                                                                                  New nucleic acid encoding antifreeze polypeptides from plants -
particularly with chitinase activity, used to impart frost, and
pathogen, resistant to plants, for preservation of foods, cells etc.
and for treating tumours
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 954 BP; 162 A; 335 C; 306 G; 151 T; 0 other;

The sequence given represents the rice chitinase gene. The promoter region of this gene (see AAQ31407) is responsive to physical and/or biological stress. The pattern of expression of this gene in mature plants is characteristic. There is a low level of expression in leaves, a moderate level in plant stems and the highest level in roots and the male and female parts of the plant. The chitinase promoter sequence may be linked to a reporter gene for expression in mono- or dicotyladon plants. Expression of this reporter gene may be used to study patterns of development and controlled expression of plant defence genes and selectable genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      -aatggetgeageggeggeaceeeggtaeeggtaeegaeeeeeteeggeggeggegtete 236

The present sequence encodes a chitinase designated RCH10. The specification describes chimeric receptors which are used for modulating plant responses to pathogens. The receptors computise a heterologous extracellular domain (e.g. from a Bril protein or RCH10 protein) and a kinase domain (e.g. from disease resistance protein Xa21). The Xa21 gene is a member of disease resistance genes referred to as RKK genes. When Xa21 is present in a transgenic plant, it confers resistance to Xanthomonas spp. The plant receptors containing heterologous domains are useful for modulating plant responses to pathogens including viruses, bacteria, nematodes, fungi or insects. The nucleic acids can be used to

```
The present sequence encodes a chitinase polypeptide. The specification describes glucosyl hydrolase family 19 chitinases (AAB18894, AAB18896, AAB18899, and ABB1890-015), and glucosyl hydrolase family 18 chitinases (AAB18895, AAB18957-98 and AAB18950-01). The level of chitinase in plants can be modulated to enhance disease resistance in crop plants and for control of pathogens. The chitinase polynucleotides are also useful as molecular markers for genotype in a plant, and for sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    325

This sequence encodes Chitinase G. Chitinase is an enzyme which breaks down chitin, the major protein in insect exoskeletons. The coding sequence may be used in the construction of transgenic organisms, especially plants, to produce pathogen resistant organisms. The genome of such transgenic organisms preferably contains more than one gene with pathogen inhibiting activity, each gene under the control of active promoters. The two gene products then show a synergistic increase in pathogen induced activity so that the transgenic organisms have a greater degree of resistance or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           403
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             643

The specification provides a promoter sequence (AAV49983) derived from rice associated with chitinase, specific to floral organs that allows expression of genes in the flower parts of monocotyledonous plants. The expression of desired genes specifically in the floral parts of monocotyledonous plants, allows modifications to be made in the structure or function of these parts allowing the introduction of desired characteristics such as increased resistance to bacterial attack.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This is the nucleotide sequence of a DNA molecule termed ENDO. The invention provides isolated DNA molecules which are differentially expressed during banana fruit development, and the protein products of these genes. The DNA is selected from a group comprising starch synthase, chitinase, endochitinase, beta-1,3-glucanase, thaumatin-like protein, ascorbate peroxidase, metallothionein, lectin and senescence-related protein. The regulatory elements of the genes can be used to produce chimeric genes for transformation of plants to provide controlled expression of heterologous DNA during fruit development, or in response to exogenous developmental signals, such as ethylene signals. The heterologous protein, e.g. a therapeutic protein, can be isolated from the fruit or consumed directly in the transformed fruit. The identity of the present sequence is not given. The entire DNA sequence has been decoded in all 3 reading frames to provide the amino acid sequences given in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             5530

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       QΫ
```

```
This sequence represents the coding sequence for the pumpkin chitinase. Chitinase is an enzyme decomposing chitin (not present in plant cell membranes) found in the cell membranes of fungi. Plants have this enzyme to protect themselves from pathogenic fungi. Thus this enzyme can be used to prevent plants from being infected with pathogenic fungi, and the chitinase gene can be introduced into plants to improve their resistance to diseases caused by fungi. As the amino acid sequence of the chitinase does not have any region to be cleaved by ubiquitous peptidases in cells, the chitinase produced by genetic recombination technology works for various host cells and serves for plant immunity to confer disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               enzyme; decompose; plant cell membrane; peptidase; e; pathogenic fungus; disease resistance; chitin; ss

2;
This sequence represents the coding sequence for the pumpkin chitinase. Chitinase is an enzyme decomposing chitin (not present in plant cell membranes) found in the cell membranes of fund. Plants have this enzyme to protect themselves from pathogenic fungi. Thus this enzyme can be used to prevent plants from being infected with pathogenic fungi, and the chitinase gene can be introduced into plants to improve their resistance to diseases caused by fungi. As the amino acid sequence of the chitinase does not have any region to be cleaved by ubiquitous peptidases in cells, the chitinase produced by genetic recombination technology works for various host cells and serves for plant immunity to confer disease

This sequence represents the CDNA clone pHS2, which encodes a protein having chitinase-activity derived from american elm. This protein inhibits the fungus Ophiostoma ulmi, the causative agent of dutch elm disease. The clone pHS2 may be used to transform E. coli cells for the recombinant production of the chitinase-like protein. The protein may be used in a composition to inhibit fungal infection of elm trees.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             358 ttcgcgaccacaggtagcaccgacgtcaagaagcgcgaggtggccgcgttcctcgctcag 417

                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence was isolated from a N.tabacum cDNA library following screening with a partial tobacco intracellular chitinase clone. The gene can be inserted into an appropriate plasmid for production of transgenic plants having resistance to fungal pathogens. The sequence was modified so as to obtain apoplast targeting of the protein. G(961) was mutated to a T to create a STOP codon. A second STOP codon was created by mutation of T(968) to A and a Sall restriction site was created by changing T(975) to C.
                                                                                                                                                                                                                                                                                                                                                                                                                    gacctccttggcgtcagctacggtgacaacctggactgctacaaccaaaggccgttcg 955

Such transgenic plants expressing an intracellular plant chitinase gene and a plant beta-1,3-glucanase gene within its tissues are predicted to exhibit improved resistance to pathogenic fungi. Such genes should be operably linked to promoters and terminators and optionally a gene encoding a selectable or screenable trait. Plants that overexpress the chitinase and glucanase genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     105 cetetgetgeageaagtteggtttetgeggeaceaecteegaetaetgeggeaeegge-- 162

New transgenic plants expressing chitinase and glucanase have improved resistance against pathogenic fungi, particularly against Alternaria alternata or Fusarium oxysporum f. sp. lycopersici
                                                                                                                                                                                                                                                                                                                                                                                                                                          specification describes transgenic plants which express a chitinase gene and a glucanase gene. The expression of the chitinase and beta-1,3-glucanase genes produces an antifungal effect. The transgenic plants are useful for improving plant resistance to pathogenic fungi. The recombinant polynuclectides and the process are useful for producing fungal resistant plants.
                                                                                                                                                                                                                                            Melchers LS, Meulenhoff EJS, Sela-buurlage MB;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   to construct a transgenic plant in a novel method to produce plants resistant to fungal attack. Such transgenic plants expressing an intracellular plant chitinase gene and a plant beta-1,3-glucanase gene within its tissues are predicted to exhibit improved resistance to pathogenic fundi. Such genes should be operably linked to promoters and terminators and optionally a gene encoding a selectable or screenable trait. Plants that overexpress the chitinase and glucanase genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    cctotyctycaycaagttcgytttctycgycaccacctccyactactycgycaccggc-- 162

The present sequence encodes an extracellular chitinase. The specification describes transgenic plants which express a chitinase gene and a glucanase gene. The expression of the chitinase and beta-1,3-glucanase genes produces an antifungal effect. The transgenic plants are useful for improving plant resistance to pathogenic fungir. The recombinant polynuclectides and the process are useful for producing fungal resistant plants.
                                                                                                                                                                                                                                                                                                                                            improved

IITLE OF INVENTION: Recombinant gene coding for a protein
TITLE OF INVENTION: having endochitinase activity or for a precursor thereof.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      341
